

[illegible]

5 voiceband data, and digitized phone signaling may be transported as AAL2 packets via an LAN that follows an LAN protocol that supports levels of transmission priority. The LAN protocol may be, for example, HomePNA. The packets may be formatted in a manner similar to other networking protocols for transmitting digitized voice, digitized voiceband data and digitized phone signaling, such as

15 digitized voice, digitized voiceband data and digitized phone signaling, and hence  
the higher costs associated with the logically separate network.
